

Web content is not showing correctly

Within Voyager, web content from external web sites can be integrated using the Multi-Internet control. This control is based on the WebControl component of Microsoft which uses the Internet Explorer engine.

If a web site is not shown correctly, the problem may be the emulated Internet Explorer version of this WebControl. The used version can be changed within the Windows Registry.

To use the latest Internet Explorer version, open the Windows Registry using the tool "regedit.exe". Navigate to the key "Computer\HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\Internet Explorer\Main\FeatureControl\FEATURE_BROWSER_EMULATION", create a new DWORD entry "nxaVoyager.exe". Set the value to "2af9" (hexadecimal).
