

# How to easily design picture buttons

You are looking for a quick method to create picture buttons and give them a nice design.

Use the NETx Button Editor that comes with your visualization editor.

1. Drag the *Picture Button* icon from the object catalog to your visualization page.
2. Double-click the new picture button, and the properties dialog will show up.
3. Under *Appearance / Template name*, click the *New* button. Provide a template name for the new button style. Subsequently, the NETx Button Editor starts.
4. Reuse such templates by clicking the *Load* button in the picture button properties dialog. Select a *.bcf* file from your visualization workspace's *PictureFiles* directory.
